Sir:

Transmitted herewith for filing is the patent application of

Inventor(s): Frank Labedz and Srinivas Gaddam

For: **SYSTEM AND METHOD FOR MANAGING MAINTENANCE OF BUILDING FACILITIES**

Enclosed are:

- (X) 47 pages of specification, including 70 claims and an abstract.
- () an executed oath or declaration, with power of attorney.
- (X) an unexecuted oath or declaration, with power of attorney.
- () sheet(s) of informal drawing(s).
- (X) 30 sheet(s) of formal drawings(s).
- () Assignment(s) of the invention to .
- () Recordation Form Cover Sheet.
- () A check in the amount of \$ 0.00 to cover the fee for recording the assignment(s) is enclosed.
- () Information Disclosure Statement.
- () Form PTO-1449 and cited references.
- () Associate power of attorney.
- () Priority Document.

I hereby certify that this paper is being deposited with the United States Postal Service as Express Mail in an envelope addressed to: Asst. Comm. for Patents, Washington, D.C. 20231, on this date.

1 SYSTEM AND METHOD FOR MANAGING
2 MAINTENANCE OF BUILDING FACILITIES

3 The present invention generally relates to a system and a
4 method for managing maintenance of building facilities. More particularly,
5 the invention relates to a system and a method for managing maintenance
6 of building facilities using data transfer between a server computer and a
7 plurality of client computers, each having a unique login identity.

8 The management of maintenance in building facilities
9 typically involves several processes that often have not been effectively
10 defined or integrated with one another in the past. To effectively carry out
11 such management processes, there must be a process for inspecting the
12 building facilities to determine what tasks have been done and what tasks
13 need to be done, and these tasks can change according to various schedules.
14 To have an efficient overall system, other effective processes must be
15 provided, including a work request process, a work order process, a
16 schedule tracking process, and a notification process. In most known
17 conventional systems, most of these processes have been done manually in
18 that they have been at least partially done with the use of considerable
19 human intervention, which is inefficient, costly and time consuming. In
20 addition, massive human intervention in a complex system tends to cause
21 more errors. For example, a customer's inspection orders, work requests,

1 and work orders have often been lost or not processed, which often results
2 in considerable customer dissatisfaction.

3 There are computer-implemented systems that attempt to
4 reduce the use of human intervention at various steps of such complicated
5 building facilities management maintenance. However, these systems do
6 not fully integrate the whole maintenance system. Most of them simply
7 allow customers to communicate with vendors over the web, and do not
8 provide an integrated system that minimizes the need for unnecessary
9 human intervention. Such systems often are unable to offer customization
10 of each building facility that can result in greater precision and organization
11 in the maintenance management system.

12 Accordingly, it is a primary object of the present invention to
13 provide an improved system and method for automatically and efficiently
14 managing maintenance of building facilities with minimal human
15 intervention.

16 Another object of the present invention is to provide such an
17 improved system and method that permits robust customization that can be
18 tailored to each building facility.

19 Still another object of the present invention is to provide such
20 an improved system and method that permits simple and quick
21 communications between the customer and the vendor.

22 Yet another object of the present invention is to provide such
23 an improved system and method that can use mobile computing devices
24 that can configured to display selective data for each assigned job site.

25 A further object of the present invention is to provide such an
26 improved system and method that can operate on a worldwide scale using a
27 large-scale network, such as the Internet.

BRIEF SUMMARY OF THE INVENTION

The present invention is directed to a method and a system for managing maintenance of a building facility using data transfer between one or more server computers and one or more client computers. The system and method allows full integration of the maintenance management process using a computer-implemented system to minimize human intervention and increase system efficiency and accuracy, while reducing operating costs.

More particularly, the system and method are adapted to utilize one or more client computers connected via a large-scale network such as the Internet to a server with a central database. Such client computers can be personal computers, other computers, or mobile computing devices, such as PDA's as well as cell phone devices. Any of these devices will hereinafter be referred to simply as a client. From the central database, job sites are tracked and monitored for fulfillment of inspections, work requests, work orders, or any other scheduled items. In addition, the present invention can automatically send out requests or events responsive to data stored in the central database without human intervention. As a result, the system is adapted to customize each job site and maintain precision and organization with minimized human intervention.

In accordance with an important aspect of the present invention, the system includes one or more server adapted to receive events from a client and forward the events to a clearinghouse via a communication link, one or more client having a unique login identity and adapted to selectively send events to the server via the communication link, and a clearinghouse connected to each server and each client via the communication link for selectively storing data from each server and each client in a database. The clearinghouse is further adapted to selectively authorize predetermined events by each client according to the login

1 identity of each such client, to selectively schedule predetermined events in
2 response to data stored in the database and to monitor the status of all
3 events stored in the database.

4 DESCRIPTION OF THE DRAWINGS

5 FIGURE 1 is an exemplary schematic diagram of a network
6 system in which the present method can be implemented;

7 FIG. 2 is a schematic diagram of the components
8 implemented in the present invention;

9 FIG. 3 is a flow chart illustrating the overall general scheme
10 of the present invention;

11 FIG. 4 is a flow chart illustrating a preferred mobile
12 computing device session;

13 FIG. 5 is a flow chart of the download-tasks event;

14 FIG. 6 is a flow chart of the upload-tasks event;

15 FIG. 7 is a flow chart of the perform-task event;

16 FIGS. 8a through 8d illustrate example displays of the mobile
17 computing device;

18 FIG. 9 is a flow chart illustrating an overall scheme of a
19 session initiated by a user (i.e., a maintenance person) of a client, not using
20 a mobile computing device with preloaded software described in FIGS. 4 to
21 8, for connection with the server;

22 FIG. 10 is a flow chart of the job site-setup event;

23 FIG. 11 is a flow chart the contact-setup event;

24 FIG. 12 is a flow chart the vendor-setup event;

25 FIG. 13 is a flow chart of the inspection-setup event;

26 FIG. 14 is a flow chart of the checklist-item-setup event;

27 FIG. 15 is a flow chart of the performance-rating-method-
28 setup event;

1 FIG. 16 is a flow chart of the performance-rating-type-setup
2 event;
3 FIG. 17 is a flow chart of the special-action-setup event;
4 FIG. 18 is a flow chart of the inspection-templates-setup
5 event;
6 FIG. 19 is a flow chart of the schedule-setup event;
7 FIG. 20 is a flow chart of the inspection-processing event;
8 FIG. 21 is a flow chart of the notification event;
9 FIGS. 22a through 22c comprise a flow chart of the work-
10 request event;
11 FIG. 23 is a flow chart of the work-request-processing event;
12 FIGS. 24a and 24b comprise a flow chart of the work-order
13 event;
14 FIG. 25 is a flow chart of the work-order-processing event;
15 FIG. 26 is a flow chart of the general scheme of the
16 scheduling process; and,
17 FIG. 27 is a flow chart of the general scheme of the
18 monitoring process.

19 DETAILED DESCRIPTION OF THE INVENTION

20 Broadly stated, the present invention is directed to a system
21 and a method for managing operational facilities; the system or method
22 being of the type that utilizes predefined events to carry out managing
23 operations for the facilities. The system includes at least one server adapted
24 to receive events from a client and forward the events to a clearinghouse via
25 a communication link. In addition, the system includes at least one client,
26 but preferably hundreds if not thousands of clients, each of which having a
27 unique login identity, adapted to selectively send events to the server via
28 the communication link. Also included in the system is a clearinghouse
29 connected to each server and each client via the communication link for

1 selectively storing data from each server and each client in a database. The
2 clearinghouse is further adapted to selectively authorize predetermined
3 events by each client according to the login identity of each such client, to
4 selectively schedule predetermined events in response to data stored in the
5 database and to monitor the status of all events stored in the database.

6 It is contemplated that the present invention can be
7 implemented for various operational managing systems, such as janitorial,
8 electrical, plumbing, drywall, lawn care, plant care, waste removal, parking
9 lots, and roofing. In addition, other operational managing systems are also
10 contemplated. For example, a heating, ventilating, and air conditioning
11 (HVAC) system or a window cleaning, installation, and repair system can
12 also be implemented with the present invention. Other examples include
13 energy management, carpentry and general repair, pool maintenance,
14 boilers and furnaces maintenance, lighting and signage maintenance, and
15 tree trimming. Although the previous examples focus mainly on the facility
16 operational maintenance, the present invention contemplates other
17 managing systems dealing with different entities, such as property
18 management, security guards, tenants of commercial office buildings,
19 elevator services, fire protection services, equipment maintenance,
20 appliance repair, furniture repair, road repair, trucking services, and locks
21 and access control systems. It is further anticipated that the present
22 invention can be implemented with all kinds of inspection systems for
23 safety, water and soil sampling, aviation, boat, ship, plumbing code,
24 electrical code, and surveyors.

25 Another implementation relates to the medical services. For
26 example, the present invention can manage home use medical equipment
27 and home nursing care. In addition, customer and vendor related services,
28 such as a bidding service, can also be included within the present invention.
29 For example, the bidding service provides a gateway for a customer to
30 propose bids to many vendors in a single transaction, which benefits both

the customers and vendors. As a result, the customers are connected to the vendors more efficiently, reducing the overall management time for transactions.

The present invention can add another dimension in facility management with an employee tracker system, for example. Employees can carry a mobile computing device (“MCD”) with customized data for completing a specific task, while the MCD incorporates a Global Positioning System (“GPS”) for tracking the employee. The coordinates registered from the GPS can be integrated into the different events almost at any time in the process depending on the type of event involved. For example, the coordinates can be logged whenever the user answers a question proposed during an event or upon completion of an event. Another alternative is logging the coordinates once during the opening of the event and another time when the same event is closed. The logged coordinates can either be sent to the server as data for storage in the database or be included in the events that are created in response to the processing of the previous event.

The GPS can ensure that the employees having MCD's were actually at the site at a specific time to complete a particular task. Another example is implementing the present invention in a trucking business for dispatching and tracking the use of the trucks and trailers. The implementation can change with the customer's demands or the needs for special customization. For example, the present invention requires different customization if the customer is an insurance adjuster. Other examples include property appraisers, case workers, probation officers, and telecommunication and cable installers, which all require different customizations. Basically, the present invention can be implemented for any system with complex management interrelations with various components in the system. As a result, there are many ways to implement

1 extracting data 22 from the database for further communication with one of
2 the servers 14, which is also connected to one or more clients 12. The
3 server 14 is, among other things, a gateway for the client 12 to
4 communicate with the clearinghouse 18.

5 Although the data involved is generally a text file or database
6 file containing textual and numerical information, the present invention
7 contemplates the use of other data formats for use with graphic, audio and
8 video files. Presently, the current available bandwidth speed makes it
9 difficult, if not impracticable to send photographs or video over the
10 transmission. However, as bandwidth increases and technology improves,
11 the implementation of these types of data is very feasible. For example, an
12 inspector can send an image of an area that needs to be further attended by
13 a staff member. Rather than using only textual language, a description with
14 the use of visual data makes communications between parties more clear
15 and efficient. The present invention, therefore, contemplates the use of
16 visual and audio data in addition to purely textual data as an
17 implementation within the present invention.

18 Both the clearinghouse 18 and the client 12 can create events
19 24 that trigger certain predefined actions from any of the components
20 depending on the type of the event. In addition, data 22 can be transferred
21 between the clearinghouse 18 and client 12, and the clearinghouse in turn
22 saves or retrieves the data from the database 20. Although these
23 components are shown as a separate unit, they can be placed in a single
24 unit. For example, for a smaller scale implementation, it may be preferable
25 for the server 14 to contain both the clearinghouse 18 and database 20. In
26 contrast, it may be preferred that all the components remain in separate
27 computers for a larger scale implementation. The arrangements of these
28 components can vary and are within the scope of the present invention.

29 A flow chart of the overall general scheme of the present
30 invention is shown in FIG. 3 for an overall system that has events that

1 generally interact with each other. The events of work-request 26, job site-
2 setup 28, inspection-setup 30, scheduling 32, notification 34, and
3 monitoring 36 are all integrated and can interact with one another within
4 the system. In addition, the client 12, which generally represents a vendor
5 which may supply goods and/or services or a customer of the entity which
6 operates the system, can initiate these events, which in turn can trigger
7 other events, such as a work-order 38 and inspections-processing 40. The
8 client 12 itself can also trigger some of the events, specifically a work-
9 request 26, a job site-setup 28, an inspection-setup 30, a notification-34, a
10 work-order 48, and an inspection-processing event 40. Also, the
11 clearinghouse 18 can initiate any of the events.

12 The interaction among these events is generally maintained
13 by the clearinghouse 18. For example, the work-request event 26 can
14 initiate the work-order event 38 and vice versa. The inspection-processing
15 event 40 interacts with both the inspection-setup event 30 and the
16 notification event 34 at a certain point in the process. A more detailed
17 explanation of how certain events relate and react to one another will
18 follow below in order to provide a clear understanding of how the system
19 works as a whole.

20 As previously mentioned, the client 12 can be a mobile
21 computing device, and a customer or a vendor can login on the system
22 using the client. In the case of a vendor using a client for processing a
23 subroutine, such as inspection processing 42, the client 12 is preferably a
24 mobile computing device. The client 12 also is preferably preloaded with
25 certain data according to the assigned job sites of the user of the device.
26 Since the login of these mobile computing devices is different from a client
27 that is a personal computer, specific processes are provided for the devices,
28 which are shown in FIG. 4.

29 Although a process for the MCD with preloaded data and
30 software is provided in FIG. 4, the present invention contemplates using

1 portable devices with wireless Internet access, such as a Personal Digital
2 Assistant or Pocket PC. The MCD, in this case, responds or sends events
3 preferably by connecting to the web page directly on the MCD. As a result,
4 there is no need to preload the MCD with software or data. The needed
5 data will be displayed through the web page. In this instance, the MCD
6 does not need the process described in FIG. 4. This alternative
7 implementation is within the scope of the present invention.

8 The flow chart of FIG. 4 illustrates a preferred mobile
9 computing device ("MCD") session, which is triggered by the device user
10 (block 42). The process begins (block 44) by the user starting a client using
11 software that was previously installed and specifically designed for the
12 MCD 12, which will be referred to as the task list program ("TLP") (block
13 46). The MCD 12 next enters a username and a password to sign onto the
14 server 14 (block 48), and checks whether the login was successful (block
15 50). If the login was unsuccessful, the MCD 12 displays an error message
16 from the server 14 explaining why the login failed (block 52).

17 If, on the other hand, the login was successful (block 50), the
18 MCD 12 will establish a connection with the server and start
19 communicating with the server for downloading of the task list (block 54).
20 The MCD 12 then downloads the task list in an in-box designed for the
21 login identity of the user from the server (block 56), which initiates a
22 download-tasks event (block 58) shown in FIG. 5 and will be explained in
23 greater detail below. After the download-tasks event has been processed
24 (block 58), the MCD next uploads completed tasks in its out-box for this
25 user (block 60), which initiates the upload-tasks event (block 62) shown in
26 FIG. 6 and will again be explained later in great detail.

27 Because a successful login gives the MCD a specific user
28 identity matching stored information in the database, the user of the MCD
29 still has a choice to download tasks, upload tasks, perform a task, or exit the
30 TLP (block 64) with or without a specific user identity. If the user wants to

1 download tasks from the server (block 64), the download-tasks event is
2 initiated (block 66). Similarly, the upload-tasks event is initiated (block 62)
3 if the user chooses to upload tasks to the server (block 68). If the user
4 chooses to perform a specific task on the MCD (block 64), a perform-task
5 event is initiated (block 70) which is shown in FIG. 7 and will be described
6 in detail. Finally, the user can also exit the process (block 72) by choosing
7 to exit the TLP (block 64).

8 A flow chart of the download-tasks event 66 is shown in FIG.
9 5, and is initiated by the MCD (block 74), and the process begins (block 76)
10 with the MCD checking the connection with the server (block 78). If the
11 MCD is not connected, the user has to login using a username and
12 password (block 80). Then, it is checked again if the login was successful
13 (block 82). If not, the MCD displays an error message from the server
14 (block 52) and brings the user back to the choices of downloading tasks,
15 uploading tasks, perform a task, or exit TLP (block 64). Otherwise, once
16 the connection with the server is established (blocks 78, 82), the next step is
17 to move a task pointer to the beginning of the new task list (block 84). The
18 MCD 12 downloads the first task in the task list from the in-box for this
19 user (block 86) and determines whether the downloaded task list data is
20 valid (block 88). If the data are valid (block 88), the MCD determines
21 whether that is the end of the task list (block 90). If so, the process ends
22 (block 92). Otherwise, it loops back and downloads the next task from the
23 list (block 94).

24 On the other hand, if data is invalid on the task list (block 88),
25 the MCD is prompted to determine whether the connection with the server
26 is still valid (block 96). The MCD will make an entry in the exception log
27 (block 98) if the connection is no longer valid (block 96), and the process
28 ends (block 92). Otherwise, when the connection is still valid (block 96),
29 the MCD increments a retry count (block 100) and determines whether the
30 incremented retry count has reached its predefined maximum number of

1 retries (block 102). Again, if maximum number of retries has been reached
2 (block 102), an entry in the exception log will be made (block 98) and the
3 process ends (block 92).

4 A flow chart for the upload-tasks event 68 is shown in FIG. 6
5 and is triggered by the TLP (block 106) and starts the process (block 108).
6 It is first determined whether the MCD is connected to the server (block
7 110). If not, the user must enter a username and a password to establish a
8 connection with the server (block 112). However, if the login is
9 unsuccessful (block 114), the process loops back to display an error
10 message from the server to the user (block 52), after which the user is given
11 the option to choose whether to download tasks, upload tasks, perform a
12 task, or exit TLP (block 64).

13 If the login is successful (block 114), similar to the download-
14 tasks event 72, the task pointer moves to the beginning of the completed
15 task list (block 118) to ensure that the first completed task is uploaded. The
16 MCD 12 uploads the first task in the list from the out-box for this user
17 (block 118), and determines whether the upload is successful (block 120).
18 The MCD 12 determines whether this is the end of the task list (block 122)
19 and if the upload was successful (block 120). If so, the process ends (block
20 124). Otherwise, it loops back and downloads the next task from the list
21 (block 126).

22 On the other hand, if the upload proves to be unsuccessful
23 (block 120), the MCD is prompted to verify that the connection with the
24 server is still valid (block 128). The MCD will make an entry in the
25 exception log (block 130) if the connection is not valid (block 130), and the
26 process ends (block 124). Otherwise, when the connection is still valid
27 (block 128), the MCD increments a retry count (block 132) and determines
28 whether the incremented retry count has reached its predefined maximum
29 number of retries (block 134). Again, if maximum number of retries has

1 been reached (block 134), an entry in the exception log will be made (block
2 130) and the process ends (block 124).

3 Referring to FIG. 7, which illustrates a flow chart of the
4 perform-task event 70, the user first selects a task from the task list stored
5 in the MCD (block 138) and elects to perform the selected task (block 140).
6 Then, the MCD opens an associated task execution program ("TEP"),
7 which runs the MCD from this point (block 142). The TEP is generally a
8 program displaying a specific template or form that is designated to the
9 selected task with its customization. For example, if the selected task is for
10 a specific job site having predefined custom checklist items for an
11 inspection, then the TEP displays the form with the predefined checklist
12 items for the user to complete the inspection as requested by the job site.
13 This allows for customization and provides simpler ways to accomplish a
14 specific task, because the MCD can display the correct forms that match the
15 selected task to the user. In this example, the user is shown a series of
16 screens necessary to accomplish the selected task (block 144). However, at
17 any given point during this process, the user can choose to complete the
18 task or stop and return to the TLP (block 146).

19 The TEP displays the first checklist item of the selected task
20 for a response from the user (block 148). The user can then choose to
21 respond, stop or skip this particular checklist item (block 150). If the user
22 chooses to stop the TEP (block 152), the TEP ends and passes control back
23 to the TLP (block 154). On the other hand, if the user does not choose to
24 stop the TEP (block 152), the user must choose to either skip or respond to
25 the checklist item. The TEP stores the response for this checklist item if
26 the user responds to the checklist item (block 155) and proceeds to the next
27 checklist item once that is done (block 156). However, the next checklist
28 item is still displayed (block 156) even if the user chooses to skip this
29 checklist item. It is then determined whether the selected task is completed
30 (block 158). In other words, the routine determines whether the user has

1 completed all of the checklist items. If the task is completed, the TEP ends
2 itself and passes control of the MCD back to the TLP. Otherwise, the
3 process loops back for the next checklist item for the user to choose one of
4 the available options (block 150) and continues until the task is completed.

5 Four exemplary display screens on the mobile computing
6 device are shown in FIGS. 8(a) to (d). As an example, assume that the
7 previous selected task is an inspection of a specific job site, the TEP
8 displays a first screen showing the name of the inspector, the name of the
9 building, the address of the building, the location of the building for
10 inspection, date, and the inspection type (shown in FIG. 8(a)). The user can
11 change any of these fields at this point. In addition, from this first screen,
12 the user can choose to start the inspection or exit the TEP. If the user
13 chooses to start the inspection, the next screen is preferably a weekly
14 inspection form shown in FIG. 8(b), since the first screen displayed a
15 weekly inspection type. The user can select any of the items listed on the
16 screen. The next screen shown in FIG. 8(c) is a display of the "signage,
17 prices, labels correct" item in FIG. 8(b). Finally, FIG. 8(d) shows an
18 example message screen for sending an email using the MCD. Many other
19 screens are available and the arrangement of these screens can be changed
20 and are within the scope of the present invention.

21 An overall scheme of a session initiated by a user of the client
22 12 not using a MCD with preloaded software for connection with the server
23 14 through, for example, the Internet is illustrated in the flow chart of FIG.
24 9. As previously mentioned, the client can be a personal computer or a
25 MCD. Both the personal computer and the MCD connect with the server
26 14 via the Internet in a web browser environment. In this preferred
27 embodiment, the MCD is not preloaded with anything. Rather, the MCD
28 has a general wireless Internet connection with a web browser capability.
29 From that, it is able to respond or send events by visiting various web pages
30 that are available on the web site. In fact, it is preferred that all setup

1 processes, such as a jobsite-setup event, be done in the web browser
2 environment.

3 As an example, the process is triggered by the client opening
4 the home page provided for the implementation of the present invention
5 (block 160). Although the preferred connection is through a web page
6 setting, it is not necessary. For example, the present invention can be
7 implemented using other connections, such as a private network. These
8 alternative connections are within the scope of the present invention.
9 However, a XML web page environment is preferred because it can
10 presently provide the most flexible and simplest environment for the
11 implementation of the present invention. Regardless, the preferred
12 environment can change with technology, and other possible alternatives
13 are also within the scope of the present invention.

14 The session begins (block 162) with the user first providing a
15 username and a password in order to log into the server and becomes an
16 authorized client (block 164). The server next determines whether this is a
17 valid user (block 166). If not, the server makes an entry in the security log
18 (block 168) and the process ends (block 170). The user can then choose an
19 option from the menu (block 172). The options include initiating a job site-
20 setup event 28, an inspection-templates-setup event 174, work request
21 event 26, work order event 38, schedules-setup event 32, and contacts-setup
22 event 176. Once the selected option has been processed, the session checks
23 if the authorized client wants to continue with choosing the options in the
24 menu (block 178). If so, it loops back to the option menu (block 172).
25 Otherwise, the session ends (block 170).

26 A more detailed description of the jobsite-setup event 28
27 previously described in FIGS. 3 and 9 is shown in the flow chart of FIG.
28 10. This event is generally initiated by the user of the client 12 (block 180).
29 The process begins (block 182) by giving the user of the client a choice of
30 adding new data, editing existing data, or exiting from the event (block

1 184). If exiting the job site-setup event is selected, the process ends at that
2 point (block 186). The server displays the existing data to the client for
3 revision for the choice of editing existing data, and the process continues on
4 to the next step when the option of adding new data is selected (block 188).
5 The user generally first adds or revises the job attributes, the name and
6 address of the building facility or other information that helps identify the
7 building (block 190). The user next adds or revises the identification of the
8 various parts, sections, or areas of the job site (block 192).

9 Next, the user sets up the contacts for the job site (block 194),
10 which will initiate the contact-setup event shown in greater detail in FIG.
11 11. Then, the user sets up the vendors for the job site (block 196) initiating
12 the vendor-setup, which is shown in FIG. 12. After that is done, the user
13 has to set up the inspections initiating the inspection-setup event (block
14 200) and special actions initiating the special-actions-setup event (block
15 204). For each inspection that is setup, the user defines a schedule for the
16 inspection (block 208), which is followed by defining defaults for any
17 information needed for the job site (block 210). The server 14 saves all the
18 information onto the database (block 212). It is next determined whether
19 the user wants to continue setting up another job site (block 214). If so, the
20 process loops back to the option menu (block 184). Otherwise, the process
21 ends (block 186).

22 The contact-setup event 194 is shown in more detail in the
23 flow chart of FIG. 11, and is generally initiated by the user of the client
24 (block 216). However, as shown in FIG. 10, it can also follow from
25 another event. The process begins (block 218) initially by giving the user
26 an option menu for adding new data, editing existing data, or exiting the
27 contact-setup event (block 220). If exiting the contact-setup event is
28 selected, the process will end (block 222). Otherwise, the server displays
29 the existing data to the client for revision (block 224) when editing existing
30 data is selected, and the process continues on to the next step when adding

1 new data is selected. The user generally first adds or revises the contact
2 attributes, the name and address of the contact, or other information that
3 helps identify the contact (block 226). Next, the user defines the method of
4 communications with the contact (block 228), which follows with the
5 contact's preferences and communication method for various events (block
6 230). The user also defines the communication backup preference in cases
7 when the contact is not accessible (block 232). The type of client used by
8 the user is also defined within the contact data (block 234). The server then
9 saves the contact data in the database (block 236) and determines whether
10 the user wants to continue with the contact-setup event (block 238). If so,
11 the process goes back to the option menu (block 220). Otherwise, the
12 process simply ends (block 222).

13 Referring again to the vendor-setup event 196, it is shown in
14 more detail in the flow chart of FIG. 12. The vendor-setup event 196 is
15 generally initiated by the user of the client (block 240), but as shown in
16 FIG. 10, it can also follow from another event. The process starts (block
17 242) with the server displaying a job vendor association screen to the client
18 (block 244), in which the user has a choice to add new data, edit existing
19 data, or exit the vendor-setup event (block 246). If exiting the vendor-setup
20 event is selected, the process will end (block 248). Otherwise, the server
21 allows the client to add a new vendor in the vendor master list stored on the
22 database (block 250). Alternatively, if the user wants to only edit existing
23 data, the process moves to the next step. At which time, the user defines
24 the vendors and the service type for each job site (block 252). In addition,
25 if applicable, information of sharing permissions for the vendor can also be
26 added or revised in this step. After the user finished revising the vendor
27 data, it is then saved onto the database (block 254). It is then determined
28 whether the user wants to continue in the vendor-setup event (block 256).
29 The process will end (block 248) if the user does not want to continue in

1 the vendor-setup event, otherwise the process loops back to the option
2 menu (block 246).

3 With regard to the inspection-setup event 200 (FIG. 10), it is
4 shown in more detail in FIG. 13, and is generally initiated by the client
5 (block 258). Similarly, the process starts (block 260) with an option menu
6 for adding new data, editing existing data, and to exit the inspection-setup
7 event (block 262). If exiting the inspection-setup event is selected, the
8 process ends (block 264). Otherwise, the server displays the existing data
9 to the client for revision if editing existing data is selected (block 266), and
10 the process continues on to the next step when adding new data is selected.
11 The user generally first adds or revises the inspection attributes,
12 description, or other useful information about the inspection (block 268).
13 For each area of the job site, the user defines the inspection steps using
14 items from an existing checklist for this job site or from a default inspection
15 template stored on the database (block 270). The user next revises the
16 checklist items as needed (block 272), and the checklist-item-setup event
17 274 is initiated (block 276). The checklist-item-setup event 274 is shown
18 in FIG. 14, and will be described below in greater detail. The server saves
19 the revised inspection data including inspection records and schedules onto
20 the database (block 278), and determines whether the user wants to
21 continue with the inspection-setup event (block 280). If so, the process
22 goes back to the option menu (block 262). Otherwise, the process ends
23 (block 264).

24 The checklist-item-setup event 274 previously mentioned in
25 FIG. 12 is shown in more detail in the flow chart of FIG. 14. Although this
26 event follows from the inspection-setup event, the event can be initiated by
27 the client at any point in the whole system (block 282). The process starts
28 (block 284) similarly with an option menu for adding new data, editing
29 existing data, or exiting the contact-setup event (block 286). If the user
30 chooses to exit the checklist-item-setup event, the process ends (block 288).

1 If not, the server displays the existing data to the client for revision (block
2 290) if the user chooses to edit. If, however, the user chooses to add data,
3 the process continues to the next step. The user can add or revise the
4 checklist item attributes, description, or other useful information about the
5 checklist item (block 292). The user enters or edits questions or statements
6 to the inspector, and the response type will also be setup along with the
7 performance rating method for the checklist item (block 294). The user
8 goes on to setup the performance rating method for the checklist items
9 (block 296), and the performance-rating-method-setup event 298 is initiated
10 as a result. The server saves the revised checklist-item data including
11 records and schedules onto the database (block 300), and determines
12 whether the user wants to continue with the inspection-setup event (block
13 302). Again, the process ends (block 288) if the user does not want to
14 continue. Otherwise, the process loops back to the option menu (block
15 286).

16 In accordance with an important aspect of the present
17 invention, the user can specify the desired performance rating method from
18 a number of options. This can be done as shown in the flow chart of FIG.
19 15, and this event is generally triggered by other events (block 304),
20 although it can also be triggered by the client 12. The process initially
21 begins (block 306) by giving the user an option menu for adding new data,
22 editing existing data, or exiting the contact-setup event (block 308). If
23 exiting the contact-setup event is selected, the process will end (block 310).
24 Otherwise, the server displays the existing data to the client for revision
25 (block 312) if editing existing data is selected, and the process continues on
26 to the next step when adding data is selected. The user then adds or revises
27 the performance rating method attributes and description in addition to any
28 other information that may be useful (block 314). Next, the user can add or
29 revise the performance rating type (block 316), initiating another event
30 (block 316). More specifically, the performance-rating-type-setup event is

1 initiated (block 316). Again, the server saves the revised information onto
2 the database (block 320), which is followed by a step determining whether
3 the user wants to continue with the current event (block 322). If so, the
4 process goes back to the option menu (block 308). Otherwise, the process
5 simply ends (block 310).

6 More specifically, with regard to selecting the performance
7 rating type block 316 and referring to FIG. 16, it is triggered by the
8 performance-rating-method-setup event (block 324). The process starts
9 with an option menu of three performance rating types (block 328),
10 specifically yes/no, multiple options, and numeric scoring. For the yes/no
11 type, there will be only two valid responses (e.g., done/not done) in which
12 the user will specify the valid responses (block 330). However, the two
13 valid responses are mutually exclusive, meaning the logic should prevent it
14 from choosing both at the same time. Next, for the multiple options type,
15 any number of options (e.g., good, fair, or poor) are possible (block 332),
16 and the user has to specify each available option in this setup. But only one
17 option is allowed as a valid response. Similarly, the logic allows only one
18 option to be chosen. With the numeric type, the user specifies a range of
19 numeric values having a minimum and a maximum along with a step
20 interval (e.g., 1 to 10 with an increment of 0.5) (block 334). The process
21 ends (block 336) when the user finishes selecting and defining the
22 performance rating type.

23 The routine for setting up a special-action event 204 is shown
24 in FIG. 17, which is triggered by the job site-setup event 28 in FIG. 10
25 (block 338). The process begins (block 340) with the user defining a
26 special action for an individual checklist item, a group of checklist items, or
27 a job area (block 342). The user can also define special actions for each of
28 the three performance rating types discussed in FIG. 16 (block 344).
29 Alternatively, if the special actions are based on a group, the total score for
30 that group can be used as a threshold comparison for the special actions

1 (block 344). Next, the user can set up one or more actions for each special
2 action, such as notifying one or more contacts, creating a work request or
3 work order and notifying the contacts (block 346). And each special action
4 can also include a response time (block 346). The user can also setup the
5 special action to be triggered by the response from the three performance
6 rating type. For the yes/no type of action, it can be triggered by either of
7 the events (block 348). Similarly, within the multiple options type, the
8 action can be triggered by the valid response (block 350). Finally, for the
9 numeric type, the user can use a range method and define the range that
10 triggers the special actions (block 352). With that, the process ends (block
11 354).

12 To setup the inspection-templates-setup event 174 as
13 described in FIG. 9, the steps of the flow chart shown in FIG. 18 are carried
14 out. The event can also be triggered by the user of the client 12 who
15 chooses this option on the web page (block 356). The process starts (block
16 358) with an option menu of adding new data, editing existing data, or
17 exiting from the event (block 360). If exiting the job site-setup event is
18 selected, the process ends (block 362). Otherwise, either the server
19 displays the existing data to the client for revision if the edit option is
20 chosen (block 364), or the process continues on to the next step if the add
21 option is chosen. The user then adds or revises the template attributes and
22 description, or other information that may be useful (block 366). The user
23 next defines the inspection template as the inspection steps using items
24 from the checklist previously setup in FIG. 14 (block 368). The checklist
25 items can either be from an existing checklist or a default inspection
26 template stored on the database. These are the checklist items that are
27 displayed for a selected job area (block 192) in the previous discussion of
28 the perform-task event in FIG. 10. The user at this time can edit the
29 checklist items (block 370). The server then saves the revised inspection
30 template data onto the database (block 372), and determines whether the

1 user wants to continue with the inspection-template-setup event (block
2 374). If so, the process returns back to the option menu (block 360).
3 Otherwise, the process simply ends (block 362).

4 To setup the schedules 32 (FIG. 3), and referring to the flow
5 chart of FIG. 19, this event is generally triggered by an external process,
6 such as the one described previously in FIG. 9 (block 376). However, the
7 event can also be triggered by the user of the client 12 choosing this option
8 on the web page. The process starts (block 378) with an option menu of
9 adding new data, editing existing data, or exiting from the event (block
10 380). This event allows the user to setup different schedules and associate
11 them with a selected event, such as an inspection event. The process ends
12 (block 382) if the user chooses the exit option. However, if the user
13 chooses the edit option, the server displays the existing schedule data stored
14 in the database to the client for revision (block 384). Alternatively, the
15 process continues on to the next step if the add option is selected, which is
16 adding and revising the schedule attributes and description or other useful
17 information (block 386). The user next defines the schedule parameters,
18 such as the frequency of the event and whether it is rule based or fixed
19 dates based (block 388). The server saves the revised schedule data onto
20 the database (block 390), and again determines whether the user wants to
21 continue with the schedule-setup event (block 392). If so, the process goes
22 back to the option menu (block 380). Otherwise, the process ends (block
23 382).

24 The detailed steps of carrying out an inspection-processing
25 event 40 from FIG. 3 is shown in the flow chart of FIG. 20. This event is
26 generally triggered by the client sending inspection data to the server (block
27 394) either on the web page or the MCD. More specifically, the client
28 generally sends inspection data to the server, for example, once an
29 inspection is completed by the user on the MCD. The process begins
30 (block 396) by validating the sent data (block 398). If it is found that the

1 information from the clearinghouse (block 428), which was gathered from
2 the database. The clearinghouse sends the server only selected data that is
3 needed in order to process the notification event. From that information,
4 the server selects one of the four methods of communication provided as
5 previously defined in the setup events (block 430). Specifically, the
6 methods preferably include fax (block 432), email (block 434), phone
7 (block 436), digital pager (block 438), and alphanumeric (block 440) as
8 examples. However, any of these methods can be excluded, and other
9 methods can also be included. The server sends the recipient a message
10 according to whatever method that is indicated from the clearinghouse
11 (blocks 432 to 440). Next, the server examines the information from the
12 clearinghouse to see if the message should be sent to multiple devices
13 (block 442). If so, the process goes back to the selection of the
14 communication method step (block 430) and starts over again. Once all the
15 requested communication methods have been utilized (block 444), the
16 process ends (block 446).

17 With regard to a work request, it can be made according to
18 the routine shown in the flow chart of FIGS. 22(a) through 22(c). The
19 event is usually triggered by other events, but can also be triggered by the
20 user choosing this option on the web page or the MCD (block 448). The
21 process begins (block 450) with the server displaying to the client an option
22 menu with the choices to add new data, edit existing data, or exit the event
23 (block 452). If the client wants to exit the event, the process will end
24 (block 454) (FIG. 22(b)). If the client selects to add new data, the server
25 creates a list of job sites that are authorized to the user (block 456). It is
26 next determined whether the list is empty (block 458). If the list is not
27 empty (block 458), it is next determined whether the required job is in the
28 list (block 460). If the list is empty (block 458), the user is notified of the
29 list being empty (block 462).

1 Furthermore, after the notification to the user (block 462) or
2 the required job is not in the list (block 460), the server inquires whether
3 the user wants to specify a location (block 464) as shown in FIG. 22(b). If
4 the user does not want to specify a location (block 464), the server next
5 inquires whether the user wants to send a message (block 466). If not, the
6 process ends at this point (block 454). Otherwise, the user can compose a
7 message to the default contact for a work ticket without any job
8 information, or an alternative contact of the user's choice (block 468). As a
9 result, the notification event is initiated because a message is being sent
10 (block 470), and the process comes to an end (block 454).

11 However, if the user wants to specify a location (block 464),
12 the user can enter the location information and description for the work to
13 be performed with the price, payment, terms, approval notice, and due date
14 and time (block 472). At that point, the work request without a job
15 association will be saved on the database, and the default contact will be
16 notified of the work request (block 474). The notification event 34 is
17 initiated by the notification to the default contact (block 476). The last step
18 is to determine whether the user wants to notify another contact (block
19 478). The user picks another contact from a list from the server (block
20 480), and the notification event is initiated again (block 482). Otherwise,
21 the process ends (block 454).

22 Returning to the beginning of the process in FIG. 22(a), if the
23 required job is in the list (block 460) and the user selects a job from the list
24 (block 484) or an existing work request is displayed to the user (block 487),
25 the user can enter or edit the description of the work to be performed with
26 the due date and time (block 486). The server determines whether the
27 client wants to contact the default authorized client for this work request
28 (block 488). If not, the client picks another authorized client from the
29 contact list for the job site (block 490). The server then saves the work
30 request with the selected authorized client onto the database (block 492).

1 Next, the server sends the details of the work request to the authorized
2 client (block 494), initiating another notification event (block 496). The
3 process ends at this point (block 454).

4 If the work-request event originates from the MCD, which is
5 different from initiating the event on the web page, the flow chart of FIG.
6 22(c) applies. When the work-request event is triggered by the MCD
7 (block 498), the process starts (block 500) with two options of adding new
8 data or editing existing data, and is generally done during an inspection.
9 For adding new data, the user creates and edits one or more work requests
10 for the job site for which the inspection is in progress (block 502). The
11 MCD will scan the inspection data to establish whether the user has
12 permission to create such a work request (block 504). If the user does not
13 have permission (block 506), the MCD notifies the user (block 508) and
14 asks whether the user wants to send a message (block 510). If so, the user
15 composes the message to the primary contact of the job site (block 512),
16 which the server will send to the contact using the notification event 34
17 (block 514). As shown in FIG. 22(a), the process then ends (block 454).

18 Assuming the server displayed the existing data to the client
19 for revision (block 516) or the client has permission to create a work
20 request (block 506), the user will enter and edit the work request as needed,
21 which might include the description, price, payment terms, approval notice,
22 and due date and time (block 518). This information is then saved to the
23 database by the server after the client has finished revising (block 520), and
24 the revised data is sent to the designated authorized client (block 494) using
25 the notification event 34 (block 496), bringing the process to an end (block
26 454). The use of the authorized client must now process the work request,
27 which is shown in FIG. 23.

28 Turning now to FIG. 23, a flow chart of the work-request-
29 processing event for the designated authorized client of a work request is
30 shown and generally indicated as 522. The event begins (block 524) with

1 triggering from either the authorized client accessing the web page (block
2 526) or data received (block 528). If this is a user initiated session, the
3 server determines whether the client gave a record identifier for the work
4 request being processed (block 530). If the client did not supply the server
5 with a record identifier (block 530), the server prepares a list of all open
6 work requests to the authorized client for selection (block 532). The user of
7 the authorized client selects a work request from the list (block 534), and
8 the server will display the selected work request to the user (block 536).
9 The user must either accept or reject the selected work request (block 538).
10 Alternatively, when the data is sent from an authorized client to the server
11 using a MCD, for example, the server validates the received data (block
12 540). If the data is not valid (block 542), the server makes an entry in the
13 exception log (block 544) and the process ends (block 546). If the data is
14 valid, the user must then either accept or reject the work request.

15 If the user of the authorized client accepts the work request,
16 an approval code must be entered by the user, and then validate the
17 approval by entering either a password or pin number (block 548). The
18 server will then save the information onto the database and create a work
19 order for the approved work request (block 550), which will initiate the
20 work-order event 38 (block 552). If, on the other hand, the work request is
21 rejected, the user preferably requests an explanation and must also validate
22 the request with password or pin number (block 554). The server next
23 determines whether the user of the client asks for a revised work request
24 (block 556). If not, the process ends (block 546). If the user does asks for
25 a revised work request (block 556), the server updates the database with the
26 revised work request (block 558). As a result, a notification message will
27 be sent to the contact, initiating the notification event (block 560). The
28 process then ends (block 546).

29 With regard to the work-order event, and referring to the flow
30 chart of FIGS. 24(a) and 24(b), this event is triggered by the user choosing

1 this option or by other events (block 562). The process begins (block 564)
2 with an option menu from which the user can select to add new data, edit
3 existing data, or exit the current event (block 566). If the user exits the
4 current event, the process ends (block 568). If the user elects to add new
5 data, the server creates a list of job sites authorized to the current user to
6 add new work orders (block 570). It is next determined whether the list is
7 empty (block 572). If the list is not empty (block 572), it is determined
8 whether the required job is in the list (block 574). If the list is empty (block
9 572), the user is notified of the list being empty (block 576). After the user
10 has been notified (block 576) or the required job is not in the list (block
11 574), the server asks the user if a work request should be created (block
12 578). If the user elects not to create a work request (block 580), the routine
13 ends (block 568). Otherwise, a work request is created initiating the work-
14 request event (block 582) if the user decides to create one (block 580).

15 Returning back to the beginning of the process in FIG. 24(a),
16 if the required job is in the list (block 574) and the user selects a job from
17 the list (block 584) or an existing work request is displayed to the user
18 (block 586), the user can enter or edit the description of the work to be
19 preformed with the due date and time of the work order (block 588). The
20 server inquires whether the client wants to contact the default recipient of
21 the work order (block 590). If not, the client picks another recipient from
22 the contact list for the job site (block 592). The server then saves the work
23 order with the selected recipient in the database (block 594). Next, the
24 server sends the details of the work order to the recipient (block 596),
25 initiating a notification event (block 598). The process ends at this point
26 for the work order event (block 568).

27 To process a work order, and referring to the flow chart of
28 FIG. 25, the work-order-processing event begins (block 602) and is
29 triggered by either the recipient using an authorized client to access the web
30 page (block 604) or data received (block 606). If this is a user initiated

1 session, the server determines whether there is a record identifier available
2 for the work order (block 608). If the authorized client did not supply the
3 server with a record identifier (block 608), the server prepares a list of all
4 open work orders for the authorized client for selection (block 610). The
5 recipient selects a work order from the list (block 612), and the server
6 displays the selected work order to the recipient (block 614). Alternatively,
7 when the data is sent from a recipient using a MCD to the server, for
8 example, the server validates the received data (block 616). If the data is
9 not valid (block 618), the server makes an entry in the exception log (block
10 620) and the process ends (block 622). Assuming that the data is valid
11 (block 618) or that the user updated the existing work order, the server
12 updates this information onto the database (block 624). At this point, a
13 notification is sent to the contact person of the job site using the notification
14 event (block 626), and the process ends (block 622).

15 In accordance with another important aspect of the present
16 invention and referring to FIG. 26, the clearinghouse keeps a scheduling
17 process to respond to the scheduled items from a client or an event. The
18 clearinghouse preferably runs this process continuously. It begins (block
19 628) with a timer (block 630) that triggers the process (block 632). The
20 clearinghouse determines whether the process should end according to the
21 timer (block 634). If so, the process ends (block 636). However, if it is
22 determined that the process should continue (block 634), the clearinghouse
23 reads a scheduled event from a schedule list (block 638) and determines
24 whether this is the end of the list (block 640). If it is the end of the list
25 (block 640), the clearinghouse waits until it is again triggered by the timer
26 (block 632). On the other hand, if it is not the end of the list, the
27 clearinghouse responds to the scheduled event (block 642). How the
28 clearinghouse will respond to the event depends upon the type of event. In
29 addition to responding to the event in the predefined process proposed in
30 each event, the clearinghouse further sends a notification to the default

1 contact of the schedule event using the notification event (block 644). The
2 process then returns to read the next scheduled event (block 638), and
3 reruns the process from that point again.

4 The general scheme of the monitoring process is shown in the
5 flow chart of FIG. 27, which is similar to the schedule process previously
6 discussed. The clearinghouse also keeps a monitoring process that tracks
7 any overdue items and responds to the overdue items accordingly. The
8 clearinghouse also preferably runs this routine continuously. It begins
9 (block 646) with a timer (block 648) that triggers the process (block 650).
10 The clearinghouse determines whether the process should end according to
11 the timer (block 652). If so, the process simply ends at this point (block
12 654). However, if it is determined that the process should continue (block
13 652), the clearinghouse reads a check sheet item list that includes any event
14 with a due date and time (block 656). The clearinghouse further checks if it
15 has reached the end of the list (block 658). If it is the end of the list (block
16 658), the clearinghouse waits until it is triggered by the timer again (block
17 650). On the other hand, if it is not the end of the list (block 658), the
18 clearinghouse determines whether the item is overdue (block 660). If not,
19 the clearinghouse again waits until it is triggered by the timer (block 650).
20 If the item is overdue, the clearinghouse responds to the scheduled event
21 (block 642). The clearinghouse responds to the overdue item by sending a
22 notification to the contact regarding the overdue item using the notification
23 event (block 662), and the process ends (block 654).

24 From the foregoing description, it should be understood that
25 an improved method and system for managing maintenance of building
26 facilities has been shown and described, which have many desirable
27 attributes and advantages. The system and method integrate the whole
28 maintenance management of building facilities into a single system with
29 minimal human intervention. Because of the superior design of the system,
30 the present invention allows for intricate maintenance customization for

1 each building facility while maintaining precision and organization in the
2 management system.

3 While various embodiments of the present invention have
4 been shown and described, it should be understood that other modifications,
5 substitutions and alternatives are apparent to one of ordinary skill in the art.
6 Such modifications, substitutions and alternatives can be made without
7 departing from the spirit and scope of the invention, which should be
8 determined from the appended claims.

9 Various features of the invention are set forth in the appended
10 claims.

WHAT IS CLAIMED IS:

- 1 1. A system for managing operational facilities, the system
2 being of the type which utilizes predefined events to carry out managing
3 operations for the facilities, said system comprising:
4 at least one server adapted to receive events from a client and
5 forward said events to a clearinghouse via a communication link;
6 at least one client having a unique login identity and adapted
7 to selectively send events to said server via said communication link; and,
8 a clearinghouse connected to each said server and each said
9 client via said communication link for selectively storing data from each
10 server and each client in a database, and being adapted to selectively
11 authorize predetermined events by each client according to said login
12 identity of each such client, to selectively schedule predetermined events in
13 response to data stored in said database and to monitor the status of all
14 events stored in said database.
- 1 2. A system as defined in claim 1 wherein each said client
2 has a visual display associated therewith, said server being adapted to
3 access selected data from said clearinghouse and forward data to each client
4 for display.
- 1 3. A system as defined in claim 1 wherein each said client is
2 preloaded with software means adapted to send and receive events.
- 1 4. A system as defined in claim 1 wherein one or more of
2 said server, clearinghouse and client includes means for defining various
3 levels of authorization for limiting access to predetermined events.

1 5. A system as defined in claim 1 wherein one or more of
2 said server, clearinghouse and client include predefined templates for
3 selected events.

1 6. A system as defined in claim 1 wherein said predefined
2 events include one or more events selected from the group consisting of:
3 a notification event;
4 a download tasks event;
5 an upload tasks event;
6 a perform task event;
7 a jobsite setup event;
8 a contact setup event;
9 a vendor setup event;
10 an inspection setup event;
11 a special action setup event;
12 a checklist item setup event;
13 a performance rating method setup event;
14 a performance rating type setup event;
15 an inspection template setup event;
16 a schedule setup event;
17 an inspection processing event;
18 a work request event;
19 a work request processing event;
20 a work order event; and,
21 a work order processing event.

1 7. A system as defined in claim 6 wherein said clearinghouse
2 creates a notification event responsive to preselected ones of said
3 predetermined events not having been completed as prescribed and
4 therefore overdue.

1 8. A system as defined in claim 7 wherein said server sends a
2 message to a designated contact person responsive to said clearinghouse
3 having created said notification event responsive to said event being
4 overdue.

1 9. A system as defined in claim 8 wherein said clearinghouse
2 retrieves said designated contact person and contact information from said
3 database during creation of said notification event.

1 10. A system as defined in claim 1 wherein said client is a
2 mobile computing device and said communication link to said client is a
3 wireless communication link.

1 11. A system as defined in claim 6 wherein during
2 preselected ones of said events an authorized client is adapted to add new
3 data, edit existing data in said database, or exit said event.

1 12. A system as defined in claim 6 wherein during said
2 preselected ones of said events and authorized client is adapted to save
3 input data from said authorized client in said database and to display data.

1 13. A system as defined in claim 6 wherein said
2 clearinghouse selectively provides authorization to said client to request
3 events in response to said client communicating its unique login identity to
4 said server.

1 14. A system as defined in claim 13 wherein each said client
2 is adapted to request a download-tasks event to said clearinghouse after
3 authorized communication is established.

1 15. A system as defined in claim 14 wherein during said
2 download-tasks event said authorized client is adapted to:
3 download task-list data from said clearinghouse;
4 determine whether said task-list data is valid; and,
5 determine whether communication with said server is
6 disconnected when said task-list data is not valid.

1 16. A system as defined in claim 15 wherein during one of a
2 download-tasks event or an upload tasks event said authorized client is
3 adapted to make an entry in an exception log when communication with at
4 least one server is disconnected.

1 17. A system as defined in claim 16 wherein one of said
2 download-tasks event or said upload-tasks event said authorized client is
3 adapted to:
4 check communication with said server for a predetermined
5 maximum retry count when communication with said server is
6 disconnected; and,
7 make an entry in an exception log once said predetermined
8 maximum retry count has been tried.

1 18. A system as defined in claim 16 wherein during said
2 download-tasks event said authorized client is adapted to download said
3 task-list data until all tasks stored in said database for said login identity
4 have been downloaded from said clearinghouse.

1 19. A system as defined in claim 16 wherein during said
2 download-tasks event said authorized client is adapted to upload said task-
3 list data until all tasks stored in said authorized client have been uploaded
4 onto said database.

1 20. A system as defined in claim 6 wherein during said
2 perform-task event said clearinghouse is adapted to forward task-list data
3 for said login identity to said server.

1 21. A system as defined in claim 20 wherein during said
2 perform-task event said server is adapted to send said task-list data to said
3 authorized client.

1 22. A system as defined in claim 21 wherein during said
2 perform-task event said authorized client is adapted to:
3 display a list of available tasks for selection from task-list
4 data stored in said authorized client; and,
5 select an available task from said list for completion of said
6 task.

1 23. A system as defined in claim 22 wherein during said
2 perform-task event said clearinghouse is adapted to forward checklist-item
3 data for said task to said server.

1 24. A system as defined in claim 23 wherein during said
2 perform-task event said server is adapted to send said checklist-item data to
3 said authorized client.

1 25. A system as defined in claim 24 wherein during said
2 perform-task event said authorized client is adapted to display a list of the

3 checklist items from checklist-item data for completing said checklist
4 items.

1 26. A system as defined in claim 25 wherein during said
2 perform-task event said authorized client is adapted to respond, skip, or
3 stop each checklist item from said checklist-item data until all checklist
4 items have been completed.

1 27. A system as defined in claim 25 wherein during said
2 perform-task event said authorized client is adapted to:
3 exit display of said checklist item data when said authorized
4 client elects to stop said first checklist item;
5 store response data for said first checklist item when said
6 authorized client elects to respond to said first checklist item; and,
7 respond, skip, or stop a next checklist item from said
8 checklist-item data when said authorized client elects to skip said first
9 checklist item.

1 28. A system as defined in claim 6 wherein during said job
2 site-setup event said authorized client is adapted to execute:
3 a contact-setup event that allows said authorized client to
4 input and edit contact data for said job site data;
5 a vendor-setup event that allows said authorized client to
6 input and edit vendor data for said job site data;
7 an inspection-setup event that allows said authorized client to
8 input and edit inspection data for said job site data; and,
9 a special-actions-setup event that allows said authorized client
10 to input and edit special-action data for said job site data.

1 29. A system as defined in claim 28 wherein said inspection-
2 setup event further includes a checklist-item-setup event that allows said
3 authorized client to input and edit checklist-item data for said job site data.

1 30. A system as defined in claim 6 wherein said
2 performance-rating-type-setup event allows said authorized server to
3 display an option menu for a yes/no type, a multiple options type, and
4 numerical type of performance rating to said authorized client for selection.

1 31. A system as defined in claim 30 wherein said client
2 carrying out said performance-rating-type-setup event saves the
3 performance rating type data including the selected type onto said database.

1 32. A system as defined in claim 31 wherein said client can
2 define the tolerance level to create a special-action event for performance
3 rating type data stored in said database.

1 33. A system as defined in claim 6 wherein an authorized
2 client can input and edit inspection-templates data for a specific job site
3 data in said database for said inspection-templates-setup event.

1 34. A system as defined in claim 33 wherein said inspection-
2 templates data includes inspection steps according to a default checklist-
3 item data or a user defined checklist-item data stored in said database.

1 35. A system as defined in claim 6 wherein said
2 clearinghouse is adapted to respond to inspection data sent from an
3 authorized client during an inspection-processing event and determine
4 whether said inspection data from said authorized client are valid.

1 36. A system as defined in claim 35 wherein during said
2 inspection-processing event said clearinghouse is adapted to make an entry
3 in an exception log when said inspection data is not valid.

1 37. A system as defined in claim 35 wherein during said
2 inspection-processing event said clearinghouse is adapted to:

3 save said inspection data in said database when said
4 inspection data is valid; and,

5 determine whether said inspection data is within predefined
6 tolerances according to performance-rating-method data stored in said
7 database.

1 38. A system as defined in claim 37 wherein during said
2 inspection-processing event said clearinghouse is adapted to create a
3 notification event for said server to send a message of said inspection data
4 being within predefined tolerances to a contact person.

1 39. A system as defined in claim 38 wherein during said
2 inspection-processing event said clearinghouse is adapted to:

3 determine whether a special-action event is required when
4 said inspection data is not within predefined tolerances according to
5 performance-rating-method data stored in said database;

6 create a notification event for said server to send a message of
7 said inspection data not being within predefined tolerances to a contact
8 person when said special-action event is not required; and,

9 create a work-request event or a work-order event according
10 to special action data stored in said database when said special-action event
11 is required.

1 40. A system as defined in claim 39 wherein during said
2 work-request event said server is adapted to:

3 display a list of job sites approved to said authorized client
4 from said clearinghouse to said authorized client for selection when said
5 authorized client requests to add new data; and,

6 display an existing work-request data of a specific job site
7 data from said clearinghouse to said authorized client for revision when
8 said authorized client requests to edit existing data.

1 41. A system as defined in claim 40 wherein during said
2 work-request event said clearinghouse is adapted to create a notification
3 event for said at least one server to send said revised existing work-request
4 data to a contact person for approval when said list of available job sites to
5 said authorized client is empty.

1 42. A system as defined in claim 40 wherein during said
2 work-request event said clearinghouse is adapted to create a notification
3 event for said server to send a message from said authorized client to a
4 contact person when said list of job sites available to said authorized client
5 is empty.

1 43. A system as defined in claim 41 wherein during said
2 work-request event said clearinghouse is adapted to:

3 provide a predetermined authorized client according to
4 contact data stored in said database for said revised work-request data; and,

5 save said revised work-request data including said
6 predetermined authorized client in said database.

1 44. A system as defined in claim 43 wherein during said
2 work-request event said clearinghouse is adapted to create a notification

3 event for said at least one server to send said saved work-request data to
4 said authorized client.

1 45. A system as defined in claim 6 wherein during said work-
2 request-processing event said authorized client is adapted to accept or reject
3 a selected open work-request data from said list.

1 46. A system as defined in claim 45 wherein during said
2 work-request-processing event said authorized client is adapted to enter an
3 approval code when said authorized client accepts a selected open work-
4 request data from said list.

1 47. A system as defined in claim 46 wherein during said
2 work-request-processing event said server is adapted to save said work-
3 request data including said approval code in said database.

1 48. A system as defined in claim 47 wherein during said
2 work-request-processing event said clearinghouse is adapted to create a
3 work-order event for said work-request data having said approval code.

1 49. A system as defined in claim 45 wherein during said
2 work-request-processing event said authorized client is adapted to enter an
3 explanation for said selected work-request data when said authorized client
4 rejects a selected open work-request data stored in said database.

1 50. A system as defined in claim 49 wherein during said
2 work-request-processing event said authorized client is adapted to request a
3 new work-request event of another job site for approval from an authorized
4 client according to contact data stored in said database when said
5 authorized client selects to request a new work-request event.

1 51. A system as defined in claim 50 wherein during said
2 work-request-processing event said server is adapted to save said new
3 work-request event in said database.

1 52. A system as defined in claim 51 wherein during said
2 work-request-processing event said clearinghouse is adapted to create a
3 notification event for server to send a message of said new work-request
4 event to said authorized client for approval.

1 53. A system as defined in claim 52 wherein during said
2 work-request event said authorized client is adapted to display:
3 a list of job sites that are approved for selection when said
4 authorized client requests to add new data;
5 existing work-request data of a specific job site stored in said
6 database for revision when said authorized client requests to edit existing
7 data; and,
8 new work-order data for revision when said authorized client
9 selects a job site from said list.

1 54. A system as defined in claim 53 wherein during said
2 work-request event said server is adapted to:
3 notify said authorized client that no job sites are available
4 when said list of approved job sites is empty; and,
5 determines whether said authorized client requested to create
6 a work-request event.

1 55. A system as defined in claim 53 wherein during said
2 work-request event said authorized client is adapted to provide a predefined

3 recipient according to job site data stored in said database after said
4 authorized client finishes revising said work-order data.

1 56. A system as defined in claim 55 wherein during said
2 work-order event said clearinghouse is adapted to create a notification
3 event for said server to send said work-order data to said predefined
4 recipient.

1 57. A system as defined in claim 6 wherein during said work-
2 order-processing event allows said server is adapted to display a list of all
3 open work-order data from said clearinghouse available to said authorized
4 client for completion when said authorized client does not identify a
5 specific job site.

1 58. A system as defined in claim 57 during wherein said
2 work-order-processing event said server is adapted to:
3 display an existing open work-order data of a specific job site
4 for completion when said authorized client identifies a specific job site.

5 display open work-order data for completion for a specific job
6 site from said list for completion when said authorized client selects a
7 specific job site from said list.

1 59. A system as defined in claim 58 wherein during said
2 work-order-processing event said authorized client is adapted to revise said
3 open work-order data indicating completion of said work-order data.

1 60. A system as defined in claim 59 wherein during said
2 work-order-processing event said authorized client is adapted to send said
3 revised work-order data to said clearinghouse upon completion.

1 61. A system as defined in claim 60 wherein during said
2 work-order- processing event said server is adapted to:
3 receive said revised work-order data indicating completion
4 from said authorized client; and,
5 check whether said revised work-order data are valid.

1 62. A system as defined in claim 61 wherein during said
2 work-order-processing event said authorized client is adapted to save said
3 revised work-order data in said database when said work-order data is
4 valid.

1 63. A system as defined in claim 62 wherein during said
2 work-order processing event said clearinghouse is adapted to create a
3 notification event for said server to send a message of said revised work-
4 order data indicating completion to a contact person.

1 64. A system as defined in claim 63 wherein during said
2 work-order-processing event said clearinghouse is adapted to make an entry
3 in an exception log when said work-order data is not valid.

1 65. A system as defined in claim 61 wherein during said
2 work-order-processing event said authorized client is adapted to save said
3 revised work-order data onto said database when said work-order data are
4 valid.

1 67. A system as defined in claim 1 wherein said
2 clearinghouse is adapted to schedule events in response to being triggered
3 by a timer.

1 68. A method for managing operational facilities using
2 predefined events to carry out managing operations for the facilities,
3 wherein the events are exchanged between at least one client having a
4 unique login identity and at least one server connected to a clearinghouse
5 over a communication link, the method comprising the steps of:
6 selectively sending, by the client, events to at least one server
7 via communication link;
8 forwarding, by the server, said events to a clearinghouse via
9 the communication link; and,
10 authorizing, by the clearinghouse, said events from each
11 client according to said login identity of each such client;
12 storing, by the clearinghouse, said events in a database;
13 selectively scheduling, by the clearinghouse, predetermined
14 events in response to said events stored in said database, and
15 monitoring, by the clearinghouse, the status of all events
16 stored in said database.

1 69. The method according to 68 further comprising the
2 step of accessing, by the server, selected data from the clearinghouse to
3 forward to client for display.

1 70. The method according to 68, wherein said authorizing
2 step further comprising the step of defining, by the clearinghouse, various
3 levels of authorization for access to said events according to said login
4 identity of the client.

1 ABSTRACT OF THE DISCLOSURE

2 SYSTEM AND METHOD FOR MANAGING
3 MAINTENANCE OF BUILDING FACILITIES

4 The present invention relates to a system for managing
5 operational facilities that is of the type which utilizes predefined events to
6 carry out managing operations for the facilities. The system includes one
7 or more servers adapted to receive events from a client and forward the
8 events to a clearinghouse via a communication link. The system further
9 includes one or more clients, each of which has a unique login identity,
10 adapted to selectively send events to the server via the communication link.
11 Also included is a clearinghouse connected to each of the server and each
12 of the client via the communication link for selectively storing data from
13 each server and each client in a database, and being adapted to selectively
14 authorize predetermined events by each client according to the login
15 identity of each such client, to selectively schedule predetermined events in
16 response to data stored in the database and to monitor the status of all
17 events stored in the database.

The diagram illustrates a network architecture. At the top center is a cloud labeled "INTERNET OR WIRELESS CONNECTION" (10). Several devices (12), including desktop computers and a laptop, are connected to this cloud. Below the cloud, three server racks (14) are connected to the cloud. These servers are further connected to a group of desktop computers (16) at the bottom. The connections between the servers and the desktop computers are labeled with the number 10, indicating a network link. The desktop computers are arranged in two rows, with four computers in the bottom row and two in the row above it.

DECLARATION AND POWER OF ATTORNEY

As a below named inventor, I hereby declare:

That my residence, post office address and citizenship are as stated below next to my name:

That I verily believe I am the original, first and sole inventor (if only one name is listed below) or an original, first and joint inventor (if plural inventors are named below) of the subject matter which is claimed and for which a patent is sought on the invention entitled

SYSTEM AND METHOD FOR MANAGING MAINTENANCE OF BUILDING FACILITIES

the specification of which
(check one)

☒ is attached hereto.

☐ was filed on _____ as
Application Serial No.: _____
and was amended on _____
(if applicable)

That I have reviewed and understand the contents of the above-identified specification, including the claims, as amended by any amendment referred to above.

That I acknowledge the duty to disclose information which is material to the examination of this application in accordance with Title 37, Code of Federal Regulations, §1.56(a).

That I hereby claim foreign priority benefits under Title 35, United States Code, §119 and §172 of any foreign application(s) for patent or inventor's certificate listed below and have also identified below any foreign application for patent or inventor's certificate on this invention having a filing date before that of the application on which priority is claimed:

Prior Foreign Application(s)			Priority Claimed
_____ (Number)	_____ (Country)	_____ (Day/Month/Year)	<input type="checkbox"/> <input type="checkbox"/> Yes No
_____ (Number)	_____ (Country)	_____ (Day/Month/Year)	<input type="checkbox"/> <input type="checkbox"/> Yes No
_____ (Number)	_____ (Country)	_____ (Day/Month/Year)	<input type="checkbox"/> <input type="checkbox"/> Yes No

That I hereby claim the benefit under Title 35, United States Code, §120 of any United States application(s) listed below and, insofar as the subject matter of each of the claims of this application is not disclosed in the prior United States application in the manner provided by the first paragraph of Title 35, United States Code, §112, I acknowledge the duty to disclose material information as defined in Title 37, Code of Federal Regulations, §1.56(a) which occurred between the filing date of the prior application and the national or PCT international filing date of this application:

United States Application(s)

(Appl. Ser.No.)	(Filing Date)	(Status) (patented, pending, abandoned)
-----------------	---------------	--

That all statements made herein of my own knowledge are true and that all statements made on information and belief are believed to be true; and further that these statements were made with the knowledge that willful false statements and the like so made are punishable by fine or imprisonment, or both, under Section 1001 of Title 18 of the United States Code, and that such willful false statements may jeopardize the validity of the application or any patent issuing thereon.

I hereby appoint the following attorneys, with full power of substitution and revocation, to prosecute this application and to transact all business in the United States Patent and Trademark Office connected therewith, and request that all correspondence and telephone calls in respect to this application be directed to GREER, BURNS & CRAIN, LTD., Suite 8660 - Sears Tower, 233 South Wacker Drive, Chicago, Illinois 60606, Telephone No. (312) 993-0080:
